PROYECTO MY CARTERA

Desarrollado con Apache/Cordova

José Javier García Romero DAW 2015/2016

Introducción

- My cartera es una aplicación que pretende ser la agenda de un equipo de comerciales
- La aplicación permite almacenar un listado de comerciales, un listado de empresas e ir grabando las visitas de los comerciales a estas empresas para posteriormente visualizar esas rutas en un mapa.
- Esta aplicación está disponible para ser utilizada en dispositivos Android, y en breve estará disponible como WebApp.
- Los desarrollos Web y móvil son paralelos y están relacionados.

Traditional Java (2) EE technologies usage

Current situation

Modernize to Java EE 6 technologies

III C

Future situation to enable mobile capabilities

REST fits well with mobile strategy

- REST is flexible and adequate for Client-Server communication
- Communication happens over HTTP using REST styles
- *JSON over HTTP/HTTPs should be used for data-interchange
- Stateless, Cacheable, Lightweight, Scalable
- *Using HTTP verbs (DELETE, GET, POST, PUT)
- Using Web technologies and security standards
- Fully supported in JBoss EAP (Java EE 6 compliant environment) by a JAX-RS implementation (RESTEasy)

Java EE 7 + Cordova Relating Java EE 7 to Mobile Mobile Device (running Cordova) Java API for JSON JAX-RS Java API for WebSocket

Java EE 7 + Cordova

REST

- JAX-RS 2.0 is the REST development API for Java
- Major upgrade with Java EE 7. (JSR-339)
 - Client API, Aysnc, Validation, Filters/Handlers, Interceptors, and Content Negotiation.
- Server and client
- Integrates with JAXB and Bean Validation
- Annotation based, declarative
 - · @Path, @GET, @POST, @PUT, @DELETE,
- Pluggable and extensible.

Java EE 7 + Cordova

REST Example with JAX-RS

HTTP POST to http://<server>/n34/race/join/<id>/<class>

PROBLEMAS

Presentation layer migration

Standard like JSP with Servlet or JSF 2.0/2.1 and non-standard web frameworks like Struts, Tapestry, GWT, ... do not have a migration path in a mobile strategy

Client side needs a clean / fresh start

Mobile-First strategy

creating pages, UI components that address the constraints of mobile, then progressively enhances the experience to other screen spaces, features, and more

NATIVE APPS

- Single platform affinity
- Written with platform SDKs
- Must be written for each platform
- Access to all native APIs
- Faster graphics performance
- AppStore distribution

HYBRID APPS

- Cross-platform affinity
- Written with web technologies (HTML5, CSS3 and JavaScript)
- Runs locally on the device, supports offline
- Access to native APIs
- App5tore distribution

MOBILE WEB APPS

- Cross-platform affinity
- Written with web technologies (HTML, CSS, JavaScript, or Server-side (PHP, ASP.NET, etc.)
- Runs on web server, viewable on multiple devices
- Centralized updates

BIBLIOTECAS/APIS DETECCION RECONOCIMIENTO FACIAL

OpenCV

http://opencv.org/

OpenCV es una biblioteca libre de visión artificial originalmente desarrollada por Intel. Se ha utilizado en infinidad de aplicaciones. Desde sistemas de seguridad con detección de movimiento, hasta aplicaciones de control de procesos donde se requiere reconocimiento de objetos.. Contiene más de 500 funciones que abarcan una gran gama de áreas en el proceso de visión, como reconocimiento de objetos (reconocimiento facial), calibración de cámaras, visión estérea y visión robótica.

Google Visión

https://github.com/googlesamples/android-

vision

The Face API finds human faces in photos, videos, or live streams. It also finds and tracks positions of facial

landmarks such as the eyes, nose, and mouth.

Tracking.js

https://trackingjs.com

The tracking.js library brings different computer vision algorithms and techniques into the browser environment. By using modern HTML5 specifications, we enable you to do real-time color tracking, face detection and much more — all that with a lightweight core (~7 KB) and intuitive interface.

Diferencia entre Detección y Reconocimiento

Face Detection es que la librería es capaz de seguir caras en tiempo real y detectar si se sonríe, si se esta triste. Este tipo de algoritmos pueden distinguir otros objetos en una fotografía y seguirlos con la cámara (tracking)

Si seguimos a mas de un objeto cara, lo denominamos multitraking

Face Recognition

Face Recognition es cuando el algoritmo es capaz de distinguir una cara de otra. Para esto en todas las librerías es preciso entrenar al sistemas con fotografías de la persona a reconocer.

En el caso de OpenCV se recomiendan unas 20 fotografías todas del mismo tamaño y resolución.

Mi librería no implementada

Función Entrenamiento

Función Reconocimiento

Tooling

Para este proyecto se han usado y están usando.

- Android Studio 2.1.2
- Android Studio NDK r12
- Eclipse Mars 2.
- Netbeans 8.1
- Chrome Version 51.X
- Jdk 1.8
- OpenCV Versiones 2.4 /3.10
- Apache Cordova 6
- com.google.android.gms.vision de google-play-services.
- JavaCV https://github.com/bytedeco/javacv/ / https://github.com/bytedeco/javacv/ / https://code.google.com/archive/p/javacv/
